

THE COST OF EXTRACTION: PALM OIL, PETROLEUM, AND THE ENVIRONMENTAL CRISIS IN NIGERIA'S NIGER DELTA

MATHEW OGA AGBO
Federal University Kashere

ABSTRACT

The Niger Delta region of Nigeria, rich in biodiversity and natural resources, has long been a focal point of extractive industries, notably palm oil and petroleum. This paper explores the historical and contemporary trajectories of resource extraction in the region, examining how the transition from agrarian-based palm oil production to large-scale petroleum exploitation has intensified environmental degradation. While palm oil cultivation in the colonial and post-colonial eras contributed to deforestation and soil erosion, the advent of petroleum extraction introduced more severe ecological consequences, including oil spills, gas flaring, and water contamination. These environmental impacts have not only disrupted local ecosystems but also undermined the livelihoods and health of indigenous communities. The study highlights the paradox of resource wealth and environmental impoverishment, revealing how extractive activities, often driven by global demand and national economic priorities, have marginalized local populations and exacerbated socio-political tensions. Drawing on interdisciplinary sources, including environmental science, history, and political ecology, the paper argues that the Niger Delta's environmental crisis is rooted in systemic governance failures, weak regulatory frameworks, and the prioritization of profit over sustainability. It calls for a reimagining of extractive policies that centre on ecological justice, community participation, and long-term environmental stewardship. By tracing the cost of extraction from palm oil to petroleum, the study underscores the urgent need for integrated approaches to resource management that reconcile economic development with environmental preservation in Nigeria's most ecologically vulnerable region.

KEYWORDS: Extractive Economy, Palm Oil, Petroleum, Environment, and Energy.

INTRODUCTION

Nigeria's economic history is inseparable from the story of extraction. From the 19th-century palm oil trade to the 20th-century discovery of petroleum in Oloibiri, the country's trajectory has been shaped by the pursuit of natural resources for global markets. Each phase promised prosperity but left legacies of environmental degradation, social dislocation, and political contestation. The shift from palm oil to petroleum reflects a deeper continuity of what Michael Watts (2004) calls the "resource curse," where natural wealth paradoxically entrenches poverty, authoritarianism, and ecological devastation.

Palm oil was central to Nigeria's integration into the global economy. By the mid-19th century, the Niger Delta supplied Britain's industrial revolution with lubricants and candles (Aghalino, 2000; Attah, 2014). This trade reshaped land use and intensified colonial control, embedding governance structures that privileged export over local development (Aghalino, 2000). Its environmental consequences—deforestation, soil depletion, and displacement of farming—were early signs of resource dependence (Naibbi & Chindo, 2020).

The 1956 petroleum discovery reoriented Nigeria's economy. Within two decades, oil revenues eclipsed agricultural exports, making petroleum the backbone of state revenue (Usman et al., 2015; Abaka & Yebrou, 2024). Yet, as Watts (2004) and Osawe and Uwa (2023) argue, oil wealth entrenched a rentier economy marked by corruption, elite capture, and violent resource struggles. The Niger Delta, once a palm oil hub, became the epicentre of petroleum extraction, environmental destruction, and resistance (Bamidele, 2025). Palm oil to petroleum reveals a central paradox: Nigeria's natural wealth has been both a blessing and a burden. Extractive industries brought global visibility and fiscal resources but deepened inequality and environmental harm. Oil spills and gas flaring in the Niger Delta mirror earlier disruptions from palm oil monocultures. Both industries prioritize short-term profit and external demand over sustainability and local well-being. Framing Nigeria's extractive history through this lens highlights continuities in governance, environmental externalities, and marginalization.

By tracing this pathway, the article explores how Nigeria's resource pathways inform debates on sustainability, diversification, and environmental justice. As Watts (2004) reminds us, the "resource curse" is not inevitable but shaped by political choices and global pressures. Nigeria's journey from palm oil to petroleum is not just about commodities; it is a story of governance, power, and

resistance. Understanding this history is essential to charting a path beyond ‘extractivism’, toward ecological stewardship and equity.

HISTORICAL FOUNDATIONS OF EXTRACTIVE ECONOMIES

Nigeria’s extractive economy was rooted in the 19th century, when palm oil became its dominant export. After the abolition of the transatlantic slave trade, Britain sought alternative sources of wealth, and palm oil emerged as a critical raw material for the Industrial Revolution. It was essential for lubricating machinery and producing soap and candles, making Nigeria central to Britain’s industrial expansion (Aghalino, 2000; Attah, 2014). By the late 1800s, palm oil and kernels accounted for nearly 90 percent of Nigeria’s export earnings, embedding the country in the global capitalist system (Hopkins, 1973; Dike, 1956).

Colonial policies prioritized extraction for metropolitan industries through plantations, pioneer oil mills, and the regulation of indigenous production (Aghalino, 2000). Though framed as modernization, these policies served Britain’s needs over local development (Adeyeri & Adejuwon, 2012). Indigenous producers were integrated into global markets under exploitative terms, with firms like the United Africa Company dominating exports (Attah, 2014). A dual economy emerged: subsistence agriculture persisted, but fertile lands and labour were redirected to export-oriented palm oil (Naibbi & Chindo, 2020). Ecological consequences were severe. Expansion led to deforestation, soil depletion, and biodiversity loss in southern Nigeria (Izah et al., 2016). Colonial land policies disrupted indigenous tenure systems, sowing tensions that foreshadowed future resource conflicts (Jacob et al., 2024). Palm oil extraction entrenched extractive governance structures.

The 1956 petroleum discovery in Oloibiri marked a shift in Nigeria’s extractive voyage. Within two decades, oil revenues eclipsed agricultural exports, transforming Nigeria into a rentier state (Usman et al., 2015). The first commercial shipment in 1958 signalled Nigeria’s new role as a global energy supplier (Abaka & Yebrou, 2024). Yet, this transition continued colonial extractive logics (Adalikwu-Obisike & Obisike, 2019; Abdussalam, 2010). As early as the 1930s, Shell D’Arcy had exclusive exploration rights, reflecting the colonial state’s preference for foreign capital over indigenous participation (Abdussalam, 2010). The petroleum era mirrored the earlier dominance of British firms in palm oil, reinforcing external control over Nigeria’s resources (Adeyeri & Adejuwon, 2012).

Petroleum amplified colonial-era structural weaknesses. Like palm oil, it marginalized food production and entrenched a mono-product economy (Onyambayi et al., 2024). Centralized oil rents reproduced authoritarian governance, fuelling corruption, elite capture, and regional discontent (Watts, 2004). The Niger Delta, once a palm oil hub, became the epicentre of petroleum extraction, environmental degradation, and community resistance (Bamidele, 2025).

Nigeria's extractive history reveals a striking continuity: both palm oil and petroleum served external markets with little regard for local development or sustainability. Colonial policies entrenched extractive governance, and postcolonial petroleum dependence deepened. Understanding this legacy is key to addressing Nigeria's ongoing struggles with resource dependency, environmental degradation, and socio-political instability.

PETROLEUM AND THE NIGERIAN ECONOMY

Nigeria's economy has been restructured around oil. By the 1970s, crude oil accounted for 80–90 percent of export earnings and over 70 percent of government revenue (Usman, Ikemefuna, & Fatimah, 2015; Abaka & Yebrou, 2024). This dependence created both opportunities and vulnerabilities. Oil revenues funded infrastructure, expanded public employment, and elevated Nigeria's global profile as a leading OPEC member. Yet, petroleum dominance entrenched economic monoculture, fiscal volatility, and neglect of agriculture and manufacturing (Ekpo, 2022; Anaele & Ekekwe, 2023).

The 1970s oil boom epitomized this paradox. Rising prices generated massive revenues, but instead of broad-based development, these rents deepened the "resource curse" (Watts, 2004). Agricultural exports collapsed as policies and labour shifted toward oil (Ohwofasa, Aguwamba, & Adeghe, 2024). Cocoa, groundnut, and palm oil exports dwindled, increasing reliance on food imports. This reflects Dutch Disease, where resource wealth appreciates currency, making non-oil exports less competitive (Otaha, 2012; Raimi, 2025). Before oil, agriculture contributed over 60 percent of GDP and employed most Nigerians (Ekpo, 2022). By the 1980s, its share had plummeted, replaced by oil rents that fuelled consumption over investment (Anaele & Ekekwe, 2023). This neglect eroded food security and deepened rural poverty, as oil wealth concentrated in urban centres and among elites (Olukunle, 2022).

Nigeria's emergence as a rentier state reinforced this imbalance. Governments relied on external rents rather than domestic taxation, weakening the social contract (Akinola, 2022). Oil rents enabled power consolidation through patronage, corruption, and elite capture (Afolabi & Bidemi, 2019; Akhere, 2025). Centralized revenues marginalized subnational units, fuelling regional discontent, especially in the Niger Delta (Akhere, 2025).

The rentier dynamic fostered fiscal irresponsibility. Booms led to wasteful spending and subsidies, while busts triggered debt crises and austerity (Ekpo, 2022). This cycle discouraged diversification and left Nigeria vulnerable to global oil price shocks (Ohwofasa et al., 2024).

Petroleum dependency also entrenched corruption. Oil rents became the main source of political power, with elites competing for control rather than investing in productive sectors (Merit Research, 2022). This exacerbated inequality and weakened institutions, as state capacity was subordinated to rent-seeking (Akhere, 2025). Oil wealth enriched a narrow elite while most Nigerians remained in poverty (Afolabi & Bidemi, 2019).

The consequences are stark. Nigeria, once a net agricultural exporter, now imports basic foodstuffs. Its manufacturing sector is underdeveloped, and the petroleum industry—despite its revenue dominance—employs less than 1 percent of the labour force (Anaele & Ekekwe, 2023). This disconnect underscores the paradox of plenty: oil wealth has not yielded sustainable development but entrenched dependency and inequality. Petroleum transformed Nigeria into a global oil power while embedding the pathologies of the resource curse. Understanding these dynamics is essential for charting a path toward diversification and inclusive growth.

ENVIRONMENTAL FOOTPRINT OF PALM OIL

Palm oil production in Nigeria has significant environmental consequences that reshape landscapes, ecosystems, and community livelihoods. Once cultivated in smallholder systems alongside subsistence farming, palm oil has shifted toward industrial plantations and intensified processing, generating major ecological costs. Deforestation, biodiversity loss, soil degradation, and water pollution are among the most pressing impacts with long-term implications for sustainability.

Deforestation and Biodiversity Loss

Palm oil expansion has driven widespread deforestation, especially in Edo, Cross River, and Akwa Ibom States. Forest reserves like Okomu have lost over 60

percent of their cover to plantations (Buba, 2021). This reduces carbon sequestration, accelerates erosion, and disrupts hydrological cycles. The FAO ranks Nigeria among the countries with the highest deforestation rates globally, with palm oil as a major driver (Naibbi & Chindo, 2020).

Deforestation is closely tied to biodiversity loss. Converting diverse forests into monocultures has led to a 35 percent decline in species richness, affecting birds, mammals, and invertebrates (Chidi et al., 2025). Wildlife populations in Okomu Forest Reserve have plummeted due to habitat destruction (Buba, 2021), undermining ecosystem services like pollination and pest control.

Soil Degradation and Water Pollution

Palm oil cultivation degrades soil by replacing diverse vegetation. Ogunbode et al. (2022) found that palm oil mill effluents (POME) reduce nitrogen, phosphorus, and potassium levels while increasing heavy metals. Ogorure et al. (2024) observed higher acidity and reduced nutrients in Akwa Ibom soils due to unregulated POME discharge, threatening productivity and food security. Processing generates empty fruit bunches and solid residues. Izah, Angaye, and Ohimain (2016) report that untreated POME discharged into rivers depletes oxygen, kills fish, and contaminates drinking water. Solid residues contribute to land pollution and greenhouse gas emissions when improperly disposed of or burned.

Socio-Economic Impacts and Sustainable Alternatives

Communities near plantations and mills face reduced access to fertile land, declining fish stocks, and polluted water sources. These pressures exacerbate poverty and fuel land-use conflicts (Naibbi & Chindo, 2020). The displacement of smallholder farmers undermines traditional livelihoods and cultural ties to land. Despite these challenges, sustainable practices offer hope. Cleaner technologies like biogas recovery from POME can reduce pollution and generate renewable energy (Izah et al., 2016). Agroforestry systems that integrate oil palm with food crops and forest species help maintain biodiversity and soil fertility (Chidi et al., 2025). Certification schemes like RSPO offer frameworks for reducing harm, though adoption in Nigeria remains limited. The environmental footprint of palm oil—marked by deforestation, biodiversity loss, soil degradation, and pollution—reflects an extractive model prioritizing export over sustainability.

ENVIRONMENTAL FOOTPRINT OF PETROLEUM

The environmental footprint of petroleum in Nigeria is most visible in the Niger Delta, a region that has endured over six decades of oil exploration. While petroleum revenues have fuelled economic growth, the ecological and human costs have been devastating. Oil spills, gas flaring, water pollution, biodiversity loss, and severe health impacts define the lived realities of millions in this resource-rich but degraded region (Ite, Ibok, Ite, & Petters, 2013; Dzedzemoon & Ferro, 2024).

Oil Spills and Ecological Devastation

Oil spills are the most notorious consequence of petroleum extraction. Between 1976 and 2001, over 6,800 incidents released more than 3 million barrels of crude oil (Kadafa, 2012). Causes include pipeline corrosion, equipment failure, sabotage, and artisanal refining (Akhare, 2025). The impacts are catastrophic: infertile soils, destroyed mangroves, and collapsed aquatic ecosystems (Akpogheli, Igbuku, & Osharechiren, 2021). Mangrove forests, the largest in Africa, have been severely affected, with oil-coated roots suffocating vegetation and destroying breeding grounds for fish and crustaceans (Adus & Woforodo, 2024). In Ogoniland, groundwater contamination has reached depths of five meters, with benzene levels 900 times above WHO guidelines (UNEP, 2011).

Gas Flaring and Air Pollution

Gas flaring remains widespread despite pledges to end it. Nigeria burns billions of cubic meters annually, releasing carbon dioxide, methane, sulphur dioxide, and black carbon (Ajugwo, 2013; Aigbe, Stringer, & Cotton, 2023). Communities near flare sites suffer higher rates of respiratory illnesses, eye problems, and cancers (Alimi & Gibson, 2022). The World Bank links flaring to infant mortality and stunting. It also destroys crops, acidifies soils, and reduces yields (Ajugwo, 2013).

Water Pollution and Fisheries Collapse

Oil spills and effluent discharges have contaminated rivers, creeks, and groundwater. Ewim et al. (2023) document widespread pollution from hydrocarbons and heavy metals, decimating fisheries once central to local economies. Bello and Amadi (2019) note fish kills, reproductive failures, and declining seafood supplies. Fishing communities face food insecurity, income loss, and cultural dislocation.

Women, central to fish processing and marketing, are disproportionately affected (Brisibe, 2022). Polluted water sources expose communities to chronic hydrocarbon ingestion, with long-term risks including cancers and reproductive disorders (Akpogheli et al., 2021).

Biodiversity Loss and Habitat Destruction

The Niger Delta, one of Africa's most biodiverse regions, has seen its ecosystems devastated. Oil pollution has reduced species populations, disrupted migratory birds, and destroyed mangrove and swamp forests (Adus & Woforodo, 2024). Mangrove loss undermines carbon sequestration, shoreline protection, and nutrient cycling (Efe & Ogbomida, 2019).

Human Health Impacts

Petroleum pollution has staggering health consequences. Elevated rates of respiratory diseases, cancers, miscarriages, and birth defects are common in oil-producing areas (Akhare, 2025; UNEP, 2011). Life expectancy in the Niger Delta is just 41 years, far below the national average, largely due to environmental degradation (Leadership, 2025). Chronic exposure through water, food, and air has created a public health crisis.

Governance Failures and Environmental Injustice

Governance failures underlie these crises. Weak enforcement, overlapping mandates, and multinational dominance have perpetuated pollution and delayed remediation (Ite et al., 2018; Abbiba, 2024). Compensation is often inadequate, and communities are excluded from decisions (Brisibe, 2022). This has fuelled resistance, from the Ogoni struggle led by Ken Saro-Wiwa to ongoing militancy. The environmental footprint of petroleum in Nigeria is a story of wealth and waste. Oil spills, gas flaring, water pollution, biodiversity loss, and health crises have made the Niger Delta one of the world's most degraded regions. Urgent action is needed: stronger regulation, corporate accountability, community participation, and investment in remediation. Without these, the ecological and human costs will continue to overshadow economic gains.

GOVERNANCE, LAW, AND REGULATION

The governance of Nigeria's extractive industries has been shaped by a complex legal and institutional framework stretching from the colonial period to the

present. Colonial petroleum laws established state ownership and centralized control of natural resources, while post-independence legislation entrenched this model, often at the expense of environmental protection and community rights. Despite reforms, weak enforcement and regulatory capture have undermined effectiveness, perpetuating environmental degradation and social conflict in oil-producing regions.

Colonial Foundations

Nigeria's petroleum governance originated in colonial ordinances. The Petroleum Ordinance of 1889 and the Mineral Oils Ordinance of 1914 vested mineral ownership in the British Crown, granting exclusive exploration rights to companies like Shell D'Arcy (Ikpeze & Ikpeze, 2015). This legal structure prioritized imperial interests over local development (Agada & Umbu, 2023). The principle of state ownership, inherited at independence, became enshrined in Nigeria's constitutions and petroleum laws (Otu, Anyatang, Kooffreh, & Ugbe, 2024).

Post-Independence Petroleum Laws

After independence, Nigeria retained and expanded centralized ownership. The Petroleum Act of 1969 remains the cornerstone of governance, vesting petroleum ownership in the federal government (Sunny-Hart, 2023). It empowered the Minister of Petroleum to grant licenses and leases, consolidating control and enabling patronage and corruption (Shekarau, 2016). The NNPC Act of 1977 established the state oil company, while the Oil Pipelines Act (2004) regulated pipeline construction and land compensation. More recent laws—the Nigerian Oil and Gas Industry Content Development Act (2010) and the Petroleum Industry Act (PIA, 2021)—introduced local content requirements and restructured institutions (Abe, 2022; Otu et al., 2024). Enforcement remains weak, and environmental safeguards are often subordinated to revenue generation (Fayomi, Adigun, & Zubair, 2024).

Weak Enforcement and Environmental Protection

Nigeria's environmental laws include the Environmental Impact Assessment (EIA) Act of 1992, the NESREA Act of 2007, and the NOSDRA Act of 2006. In principle, these provide protection mechanisms. In practice, enforcement is undermined by institutional weaknesses, overlapping mandates, and political interference (Dike, Nweke, & Anyachebelu, 2025). The UNEP (2011) assessment of

Ogoniland revealed systemic failures, with oil spills left unremedied for decades. NEITI (2023) highlights persistent gaps in reporting and accountability. Scholars argue that agencies lack the capacity, independence, and resources to hold multinational oil companies accountable (Afeonkhai, 2023; Ihugba & Okoro, 2018).

Governance and Community Rights

A major weakness in Nigeria's legal framework is the marginalization of host communities. While the PIA (2021) introduced a Host Communities Development Trust, critics argue it offers limited participation and fails to address historical grievances (Bulama & Dike, 2025). Earlier frameworks, like the NDDC Act, were plagued by corruption and inefficiency, leaving communities with little benefit (Ihugba & Okoro, 2018). This exclusion has fuelled resistance and militancy, linking weak governance to conflict.

From colonial ordinances to the PIA 2021, Nigeria's petroleum laws have consistently centralized control and prioritized extraction over sustainability. Despite legal evolution, weak enforcement, regulatory capture, and limited community participation continue to undermine environmental protection and equitable development. Strengthening enforcement, enhancing transparency, and embedding community rights are essential to breaking the cycle of extractive governance.

COMMUNITIES AND RESISTANCE

The Niger Delta has long been the epicentre of Nigeria's oil wealth and environmental injustices. Among affected communities, the Ogoni struggle stands out as a landmark in grassroots resistance. The Ogoni people, a small ethnic minority in Rivers State, have been mobilized under the Movement for the Survival of the Ogoni People (MOSOP) to confront decades of degradation and exclusion. Led by writer and environmentalist Ken Saro-Wiwa, their activism reshaped resistance and global awareness of environmental justice in the Global South (Osaghae, 1995; Udogbo, 2021).

The Ogoni Bill of Rights and MOSOP's Emergence In 1990

MOSOP presented the Ogoni Bill of Rights, demanding autonomy, environmental protection, and a fair share of oil revenues (Saro-Wiwa, 1992; Tam-George, 2010). The Bill exposed how Shell and the Nigerian state extracted billions while leaving behind polluted rivers and ruined farmland (Human Rights Watch,

1995). MOSOP's non-violent resistance (protests, petitions, and advocacy) set it apart from later militant movements (Naibbi & Chindo, 2020).

Ken Saro-Wiwa and Global Environmental Justice

Saro-Wiwa used literary tools to amplify the Ogoni cause, framing it as a human rights and environmental issue (Boele, Fabig, & Wheeler, 2001). His efforts drew global attention, earning the Right Livelihood Award and support from Amnesty International and Greenpeace (Bassey, 2012). In 1995, Saro-Wiwa and eight other Ogoni leaders—the “Ogoni Nine”—were executed after a widely condemned trial, sparking global outrage and scrutiny of Shell's operations (Osaghae, 1995; Pegg, 1999). Their deaths turned the Ogoni struggle into a global symbol, inspiring movements from Ecuador to Canada (Watts, 2004).

Grassroots Resistance and Broader Niger Delta Activism

The Ogoni struggle galvanized other Niger Delta communities. Groups like the Ijaw Youth Council and Niger Delta Avengers drew inspiration from MOSOP, though many adopted militant tactics (Udo, 2013). Civil society organizations, including Environmental Rights Action and the Health of Mother Earth Foundation, built on MOSOP's legacy to push for remediation and accountability (Bassey, 2012; Bristol-Alagbariya, 2022). Scholars argue that the Ogoni struggle reframed oil pollution as structural violence and ecocide, influencing advocacy for stronger laws and environmental rights (Bamidele, 2025; Barigbon, 2024).

Legacy and Continuing Struggles

Despite the sacrifices of Saro-Wiwa and the Ogoni Nine, many issues raised in the Ogoni Bill remain unresolved. UNEP's (2011) Environmental Assessment of Ogoniland recommended a \$1 billion clean-up, yet progress has been slow. Communities still face polluted water, degraded land, and inadequate compensation. Still, the Ogoni struggle endures as a reminder of marginalized communities' ability to challenge global corporations and authoritarian states. It marks a turning point in Nigeria's extractive history, showing how grassroots activism can reshape global awareness and envision justice and sustainability.

Comparative Analysis: Palm Oil vs. Petroleum

Nigeria's economic history reveals parallels between the 19th-century palm oil industry and the petroleum sector since the mid-20th century. Both prioritized external markets and state revenues over local development. While palm oil reshaped

agrarian systems, petroleum's scale produced far more destructive consequences. Palm oil was once Nigeria's top export, accounting for nearly half of the global supply (PwC, 2019). Cultivation and trade were structured around colonial demands, with indigenous producers exploited (Abu, Umaru, & Enete, 2024). Its environmental impact includes deforestation, biodiversity loss, and soil degradation; though significant, these were localized (Izah, Angaye, & Ohimain, 2016). Petroleum, by contrast, reshaped Nigeria's fiscal structure, fueled Dutch Disease, and devastated the Niger Delta (Watts, 2004; Ite et al., 2013).

Both industries relied on foreign capital and technology. British firms dominated palm oil exports; multinational oil companies like Shell and Chevron control petroleum (Pegg, 1999). In both cases, profits flowed outward while local communities bore the costs (Boele, Fabig, & Wheeler, 2001). This reflects persistent extractive governance from colonial to postcolonial Nigeria (Agada & Umbu, 2023).

Petroleum's destruction far exceeds that of palm oil. Oil spills, gas flaring, and toxic effluents have rendered parts of the Niger Delta uninhabitable, triggering health crises (UNEP, 2011; Dzedzemoon & Ferro, 2024). Palm oil's footprint, though damaging, did not produce systemic contamination or long-term health impacts. Moreover, petroleum dependency has entrenched a rentier state, fostering corruption and conflict (Akinola, 2022).

A final distinction lies in global significance. Palm oil was central to Britain's industrial revolution, but later lost dominance to Southeast Asia. Petroleum remains a strategic commodity, tying Nigeria's fortunes to volatile markets and geopolitics (Ekpo, 2022). Palm oil and petroleum represent two phases of Nigeria's extractive trajectory. Both show how natural resources have been harnessed for external benefit at the expense of local communities and ecosystems. Petroleum's scale and geopolitical relevance have made its footprint far more destructive, embedding Nigeria in a cycle of dependency, degradation, and unrest.

The Niger Delta Development Commission (NDDC)

Despite the sacrifices of Ken Saro-Wiwa and the Ogoni Nine, many issues raised in the Ogoni Bill of Rights remain unresolved. The UNEP (2011) Environmental Assessment of Ogoniland recommended a \$1 billion clean-up, but progress has remained slow and contested. Communities continue to face polluted water, degraded farmlands, and inadequate compensation. The Niger Delta Development Commission (NDDC) was therefore established in 2000 to address regional underdevelopment; it has struggled to fulfill its mandate. Assessments from

2020 to 2025 reveal persistent challenges: project delays, poor monitoring, and weak accountability mechanisms have undermined its effectiveness. While the Commission has launched infrastructure and empowerment programs, many initiatives remain incomplete or poorly executed (UNEP, 2011).

PATHWAYS TO SUSTAINABILITY

Nigeria's extractive history reveals that resource wealth without sustainability deepens dependency and ecological damage. To forge a new path, the country must prioritize diversification, remediation, and ESG integration as pillars of sustainable governance. These are not mere technical fixes but political choices shaping whether natural wealth fosters equitable development.

Diversification Beyond Oil

Reducing Nigeria's vulnerability to oil price shocks and the "resource curse" requires diversification. Agriculture, renewables, and manufacturing offer alternatives. IRENA (2023) highlights Nigeria's solar and biomass potential, while the Energy Transition Plan (ETP, 2022) places renewables at the core of net-zero goals by 2060 (Chambers & Partners, 2025). Investment in agro-processing, digital innovation, and small-scale industries can generate jobs and reduce poverty (Awuchi et al., 2023). Policy coherence and financing—like blended finance and local supply chains—are vital to accelerate this shift (Sustainable Energy for All, 2024).

Environmental Remediation

The Niger Delta's environmental legacy demands urgent remediation. UNEP (2011) estimated Ogoniland's clean-up could span decades and cost billions. Progress remains slow due to weak governance and funding gaps (Maduekwe, 2018). Remediation must restore livelihoods, biodiversity, and trust (Fayomi, Adigun, & Zubair, 2024). Community-based resource management boosts accountability (Naibbi & Chindo, 2020), while integration with climate adaptation is crucial given regional vulnerability (World Bank, 2022).

ESG Frameworks and Corporate Accountability

ESG principles are essential to align extractive industries with sustainability. Despite policies like the Petroleum Industry Act (2021), ESG implementation is fragmented (Afeonkhai, 2023). Mandatory reporting, independent audits, and

alignment with global standards such as GRI and UN Guiding Principles are needed (CISLAC & Oxfam, 2025). Financial institutions can drive responsible behaviour by linking loans to ESG compliance (Fair Finance Nigeria, 2023).

Community Participation and Human Rights

Sustainable governance hinges on host community participation. A rights-based approach—recognizing the right to a clean and healthy environment—strengthens accountability (Maduekwe, 2018). Community involvement in decisions and monitoring reduces conflict and boosts legitimacy (Njoku, Iwueke, & Emezi, 2023). The Host Communities Development Trust under the Petroleum Industry Act is a positive step, though critics urge more transparency and genuine ownership (Bulama & Dike, 2025).

Toward a Just Transition

Nigeria's sustainability journey must be framed as a just transition—balancing economic diversification, environmental protection, and social equity. The African Development Bank (2023) stresses that the energy transition must meet climate goals while reducing poverty, creating jobs, and advancing gender equity.

CONCLUSION

Nigeria's voyage from palm oil to petroleum underscores the paradox of resource wealth: immense revenues have flowed into state coffers, yet poverty, inequality, and ecological devastation persist. As Obi (2010) notes, oil extraction in the Niger Delta has been marked by dispossession and conflict, revealing how extractive wealth enriches elites while harming local communities. Palm oil entrenched colonial extractive logics; petroleum deepened dependency and environmental degradation. Both prioritized external markets over local development, fuelling cycles of boom and bust, ecological harm, and social unrest. Breaking this cycle requires rethinking governance and development priorities.

Nigeria must diversify beyond oil. Reliance on crude exports has exposed the economy to price shocks and weakened agriculture and manufacturing (Ekpo, 2022). Investment in renewable energy, agro-processing, and digital industries offer a path to inclusive growth. Environmental remediation is also urgent. The UNEP (2011) Ogoniland report revealed contamination so severe that clean-up could take decades. Without sustained investment, the Niger Delta will remain a symbol of ecological

injustice. A human rights approach is essential for accountability and justice (Maduekwe, 2018).

Nigeria must strengthen sustainability frameworks through robust ESG integration. While ESG principles are gaining traction, implementation remains fragmented (Afeonkhai, 2023). Stronger enforcement, transparency, and community participation are vital to ensure extractive industries support long-term development. Ultimately, the extractive sector must embrace a just transition, balancing growth with environmental stewardship and equity. This requires not only policy reform but a cultural shift in valuing natural resources as shared assets. Nigeria's extractive history is a cautionary tale of how wealth can become a curse when governance fails. By embracing diversification, remediation, and ESG-driven governance, Nigeria can chart a new path toward a more just, sustainable, and prosperous future.
